

SurveyJS Application Overview

■ Purpose of the App

The SurveyJS-based application is designed to create, assign, manage, and analyze surveys for both general and happiness-specific feedback collection. It supports multiple languages (Arabic and English), role-based access (admins, users), and various survey formats.

■ Core Features

- Admin dashboard to create and manage surveys
- Survey assignment system (user-based or company-based)
- Two survey types: Regular SurveyJS and Happiness Surveys
- Dynamic multilingual support (English and Arabic)
- Happiness survey includes 40 questions across 5 categories (Meaning, Delight, Freedom, Engagement, Vitality)
- Happiness character matching based on 5-bit binary code logic
- PDF generation for results including character description, score, and detailed breakdown
- OTP login system for users; password-based login for admins
- Survey session tracking with progress and retake cooldowns
- Export results to Excel for admins

■■ How It Works

1. Survey Creation: Admins create surveys with SurveyJS JSON, defining structure, logic, and design.
2. Assignment: Surveys are assigned directly to users or through company linkage.
3. User Access: Users log in with email or phone OTP to access assigned surveys.
4. Taking Surveys: Surveys support multilingual UI and include conditional logic.
5. Submission: Results are stored in structured format for analysis.
6. Happiness Reports: Special logic assigns characters and generates styled PDF reports per user.
7. Admin Analysis: Admins can review submissions, export data, and manage survey availability.
